Low-Fidelity User Testing

We asked two users to complete the following tasks on our paper prototype:
1. Add SI543 to your schedule
2. Find an existing study group for SI543
3. Create a study group for SI543

Task 1.
All users were able to complete the task. However, the naming of the text box could be more descriptive of its purpose. As a result, we added more descriptive text. Instead of "type class", we renamed the description to "Enter class name." We also moved the description from inside the textbox to outside the

Task 2.
All users were able to complete the tasks without much difficulty; however, users were uncertain what to do after finding a study group. The application lacked a sense of completion for the user. We added a check in button, so users are able to check-in once in the study location.

Task 3.
All users were able to complete this task as well; however, users noted that they often do not know the address of the place they are studying. We added a GPS location button so that the user is able to add their current coordinates and quickly add a study group. We also added a check-in button for the creator of the study group, so the user has a sense of completion as well.
